Fluorite is in the composition of (CaF₂) Calcium fluoride and when pure it contains 51.3% Calcium and 48.7% fluorine. Since it is used as a slag maker in metallurgy and has a low melting point, it comes from the Latin word fluere (flow). It crystallizes in cubic system, mohs hardness is 4, specific gravity is 3.18 gr / cm³, melting temperature is 1330°C, its color is purple, green, blue, yellow, white, pink, brown and bluish black, transparent translucent mineral. In the commercial field, fluorite can be divided into three classes; 1. Used in acid industry (Asitspar or Acid class) 2. Used in the chemical industry (Seramikspar or Ceramic class) 3.Used in metallurgy industry (Metspar or Metallurgy class) Our company`s expert technical team will be happy to assist you.

Andalusite is an alumina-silicate raw material used principally in the manufacture of heat resistant refractory products. When andalusite is produced, unlike many other refractory raw materials, costly calcining is not required. On firing refractory raw materials containing andalusite, high strength mullite is formed, resulting in the superior qualities of. 1. Andalusite conversion to mullite at relatively low temperatures, imparting high hot strength and resistance to physical-chemical erosion, with very good resistance to slag penetration and alkali attack. 2. Minimum volume change when firing andalusite - containing refractory materials; dimension control of the refractory is improves. 3. High creep and abrasion resistance, high strength at high temperatures, resistance to chemical and physical erosion. Our company`s expert technical team will be happy to assist you.
